# Lab 4: Asymmetric (Public) Key

**Objective:** The key objective of this lab is to provide a practical introduction to public key encryption, and with a focus on RSA and Elliptic Curve methods. This includes the creation of key pairs and in the signing process.

Video demo: https://youtu.be/6T9bFA2nl3c

## A RSA Encryption

**A.1** The following defines a public key that is used with PGP email encryption:

----BEGIN PGP PUBLIC KEY BLOCK-----Version: GnuPG v2

mQENBFTzilABCADIEwchOyqRQmU4AyQAMj2Pn68Sq09lTPdPcItwo9LbTdv1YCFz w3qLlp2RORMP+kpdi92CIhdUYHDmZfHZ3IWTBg09+y/Np9UJ6tNGocrgsq4xwz15 4vX4jJRddC7QySSh9UxDpRWf9sgqEv1pah136r95zuyjC1EXnoNxdLJtx8PliCXc hV/v4+Kf0yzYh+HDJ4xP2bt1S07dkasYZ6CA7BHYi9k4xgEwxvVYtNjSpjTsQY5R cTayXveGafuxmhSauZKiB/2TFErjEt49Y+p07tPTLX7bhMBVbUvojtt/JeUKV6VK R82dmOd8seUvhwOHYB0JL+3s7PgFFsLo1NV5ABEBAAGOLkJpbGwgqnVjaGFuYW4G KE5vbmUpIDx3LmJ1Y2hhbmFuQG5hcGllci5hYy51az6JATKEEWECACMFAlTzi1AC GWMHCWkIBWMCAQYVCAIJCgsEFgIDAQIeAQIXgAAKCRDsAFZRGtdPQi13B/9KHeFb 11AxqbafFgRDEvx8UfPnEww4FFqWhcr8RLwyE8/COlUpB/5As2yvojmbNFMGzURb LGf/u1LVHOa+NHQU57u8Sv+g3bBthEPh4bKaEzBYRS/dYHOX3APFyIayfm78JVRF zdeTOOf6PaXUTRx7iscCTkN8DUD31g/465ZX5aH3HWFFX500JSPStO/udqjoQuAr WA5JqB//g2Gfzze1UzH5Dz3PBbJky8GiIfLm00XSEIgAmpvc/9NjzAgj0W56n3Mu sjVkibc+l1jw+r0o97CfJMppmtcOvehvQv+KGOLznpibiwVmM3vT7E6kRy4gEbDu enHPDqhsvcqTDqaduQENBFTzi1ABCACzpJgZLK/sge2rMLURUQQ6102Urs/GilGC ofq3WPnDt5hEjarwMWN65Pb0Dj0i7vnorhL+fdb/J8b8QTiyp7i03dZvhDahcQ5 8afvCjQtQsty8+K6kZFZQOBgyOS5rHAKHNSPFq45MlnPo5aaDvP7s9mdMILITv1b CFhcLoC60qy+JoaHupJqHBqGc48/5NU4qbt6fB1AQ/H4M+6og4OozohgkQb8OHox ybJv4sv4vYWULd+FKOg2RdgeNMM/awdqYo90qb/W2aHCCyXmhGHEEuok9jbc8cr/xrWL0gDwlwpad8RfQwyVU/VZ3Eg3OseL4SedEmwOO cr15xDIs6dpABEBAAGJAR8E

=ZrP+ ----END PGP PUBLIC KEY BLOCK----

Using the following Web page, determine the owner of the key, and the ID on the key:

https://asecuritysite.com/encryption/pgp1

By searching on-line, can you find the public key of three famous people, and view their key details, and can you discover some of the details of their keys (eg User ID, key encryption method, key size, etc)?

By searching on-line, what is an ASCII Armored Message?

Save the public key to your Ubuntu instance mykey.asc, and run:

gpg mykey.asc

What details can you get from the key:

#### **A.2** Bob has a private RSA key of:

----BEGIN RSA PRIVATE KEY---\nMIICXGIBAAKBQQDOIhiWs15X/6xiLAVCBzpgvnuvMzHBJk58wOWrdfyEACTY10oG\n+6auNFGqQHYHbfKaZlEi4prAo

privKeyObj = RSA.importKey(binPrivKey)
cipher = PKCS1_OAEP.new(privkeyObj)
message = cipher.decrypt(ciphertext)

print
print ("====Decrypted===")
print ("Message:",message)
```

What is the plaintext message that Bob has been sent?

Note: You may have to install Pycryptodome if this example, to do so apply the following command:

pip install pycryptodome

## B OpenSSL (RSA)

We will use OpenSSL to perform the following:

No	Description	Result
B.1	First we need to generate a key pair with:  openssl genrsa -out private.pem 1024	What is the type of public key method used:
	This file contains both the public and the private key.	How long is the default key:  Use the following command to view the keys:  cat private.pem
B.2	Use following command to view the output file: cat private.pem	What can be observed at the start and end of the file:
B.3	Next we view the RSA key pair:  openssl rsa -in private.pem -text	Which are the attributes of the key shown:
		Which number format is used to display the information on the attributes:
B.4	Let's now secure the encrypted key with 3-DES:  openssl rsa -in private.pem -des3 -out key3des.pem	Why should you have a password on the usage of your private key?
B.5	Next we will export the public key:	View the output key. What does the header and footer of the file identify?
	openssl rsa -in private.pem -out public.pem -outform PEM -pubout	

.txt
ent
_ = =

# C OpenSSL (ECC)

Elliptic Curve Cryptography (ECC) is now used extensively within public key encryption, including with Bitcoin, Ethereum, Tor, and many IoT applications. In this part of the lab we will use OpenSSL to create a key pair. For this we generate a random 256-bit private key (priv), and then generate a public key point (priv) multiplied by G), using a generator (G), and which is a generator point on the selected elliptic curve.

No	Description	Result
C.1	First we need to generate a private key with:  openssl ecparam -name secp256k1 -genkey -out priv.pem  The file will only contain the private key, as we can generate the public key from this private key.  Now use "cat priv.pem" to view your key.	Can you view your key?
C.2	We can view the details of the ECC parameters used with:  openssl ecparam -in priv.pem -text - param_enc explicit -noout	Outline these values: Prime (last two bytes): A: B:

		Generator (last two bytes):
		Order (last two bytes):
C.3	Now generate your public key based on your private key with:	How many bits and bytes does your private key have:
	openssl ec -in priv.pem -text -noout	
		How many bit and bytes does your public key have (Note the 04 is not part of the elliptic curve point):
		What is the ECC method that you have used?
C.4	First we need to generate a private key with:	Outline three curves supported:
	openssl ecparam -list_curves	
C.5	Let's select two other curves:  openssl ecparam -name secp128r1 -genkey -out priv.pem openssl ecparam -in priv.pem -text - param_enc explicit -noout  openssl ecparam -name secp521r1 -genkey -out priv.pem openssl ecparam -in priv.pem -text - param_enc explicit -noout	How does secp128k1, secp256k1 and secp512r1 different in the parameters used? Perhaps identify the length of the prime number used, and the size of the base point (G) and the prime number. How does the name of the curve relate to prime number size?

If you want to see an example of ECC, try here: https://asecuritysite.com/encryption/ecc

# **D** Elliptic Curve Encryption

**D.1** In the following Bob and Alice create elliptic curve key pairs. Bob can encrypt a message for Alice with her public key, and she can decrypt with her private key. Copy and paste the program from here:

https://asecuritysite.com/encryption/elc

Code used:

```
import OpenSSL
import pyelliptic

secretkey="password"
test="Test123"

alice = pyelliptic.ECC()
bob = pyelliptic.ECC()
```

```
print ("++++Keys++++")
print ("Bob's private key: ",bob.get_privkey().hex())
print ("Bob's public key: ",bob.get_pubkey().hex())

print()
print ("Alice's private key: ",alice.get_privkey().hex())
print ("Alice's public key: ",alice.get_pubkey().hex())

ciphertext = alice.encrypt(test, bob.get_pubkey())
print ("\n++++Encryption++++")
print ("Cipher: "+ciphertext.hex())
print ("Decrypt: "+bob.decrypt(ciphertext))
```

For a message of "Hello. Alice", what is the ciphertext sent (just include the first four characters):

**D.2** Let's say we create an elliptic curve with  $y^2 = x^3 + 7$ , and with a prime number of 89 ( $y^2 = x^3 + 7 \pmod{89}$ ), generate the first five (x,y) points for the finite field elliptic curve. You can use the Python code at the following to generate them:

https://asecuritysite.com/encryption/ecc\_points\_real (or for simpler code you can use https://asecuritysite.com/encryption/ecc\_points3)

First five points:		

**D.3** Elliptic curve methods are often used to sign messages, and where Bob will sign a message with his private key, and where Alice can prove that he has signed it by using his public key. With ECC, we can use ECDSA, and which was used in the first version of Bitcoin. Enter the following code:

```
from ecdsa import SigningKey,NIST192p,NIST224p,NIST256p,NIST384p,NIST521p,SECP256k1
import base64
import sys

msg="Hello"
type = 1
cur=NIST192p

sk = SigningKey.generate(curve=cur)
vk = sk.get_verifying_key()
signature = sk.sign(msg.encode())
print ("Message:\t",msg)
print ("Type:\t\t",cur.name)
print ("===========")
print ("Signature:\t",base64.b64encode(signature))
print ("===========")
print ("signatures match:\t",vk.verify(signature, msg.encode()))
```

NIST192p:

NIST521p:

SECP256k1:

By searching on the Internet, can you find in which application areas that SECP256k1 is used?

What do you observe from the different hash signatures from the elliptic curve methods?

### E RSA

**E.1** A simple RSA program to encrypt and decrypt with RSA is given next. Prove its operation:

```
import rsa
(bob_pub, bob_priv) = rsa.newkeys(512)
ciphertext = rsa.encrypt('Here is my message', bob_pub)
message = rsa.decrypt(ciphertext, bob_priv)
print(message.decode('utf8')
```

Remember to install "rsa" with "pip install rsa". Now add the lines following lines after the creation of the keys:

```
print bob_pub
print bob_priv
```

Can you identify what each of the elements of the public key (e,N), the private key (d,N), and the two prime number (p and q) are (if the numbers are long, just add the first few numbers of the value):

When you identity the two prime numbers (p and q), with Python, can you prove that when they are multiplied together they result in the modulus value (N):

Proven Yes/No

**E.2** We will follow a basic RSA process. If you are struggling here, have a look at the following page:

https://asecuritysite.com/encryption/rsa

First, pick two prime numbers:

```
p=
q=
```

Now calculate N (p.q) and PHI [(p-1).(q-1)]:

```
N=
PHI =
```

Now pick a value of e which does not share a factor with PHI [gcd(PHI,e)=1]:

```
e=
```

Now select a value of d, so that  $(e.d) \pmod{PHI} = 1$ :

[Note: You can use this page to find d: https://asecuritysite.com/encryption/inversemod]

```
d=
```

Now for a message of M=5, calculate the cipher as:

```
C = M^e \pmod{N} =
```

Now decrypt your ciphertext with:

```
M = C^d \pmod{N} =
```

Did you get the value of your message back (M=5)? If not, you have made a mistake, so go back and check.

Now run the following code and prove that the decrypted cipher is the same as the message:

```
import libnum

p=11
q=3
N=p*q
PHI=(p-1)*(q-1)
e=3

d= libnum.invmod(e,PHI)

print (e,N)
print (d,N)
M=4
print ("\nMessage:",M)
cipher = M**e % N
print ("cipher:",cipher)
message = cipher**d % N
```

```
print ("Message:",message)
```

Select three more examples with different values of p and q, and then select e in order to make sure that the cipher will work:

**E.3** In the RSA method, we have a value of e, and then determine d from (d.e) (mod PHI)=1. But how do we use code to determine d? Well we can use the Euclidean algorithm. The code for this is given at:

https://asecuritysite.com/encryption/inversemod

Using the code, can you determine the following:

```
Inverse of 53 (mod 120) =
```

Inverse of 65537 (mod 1034776851837418226012406113933120080) =

Using this code, can you now create an RSA program where the user enters the values of p, q, and e, and the program determines (e,N) and (d,N)?

**E.3** Run the following code and observe the output of the keys. If you now change the key generation key from 'PEM' to 'DER', how does the output change:

```
from Crypto.PublicKey import RSA
key = RSA.generate(2048)
binPrivKey = key.exportKey('PEM')
binPubKey = key.publickey().exportKey('PEM')
print (binPrivKey)
print (binPubKey)
```

### F PGP

**F.1** The following is a PGP key pair. Using https://asecuritysite.com/encryption/pgp, can you determine the owner of the keys (or use **gpg mykey.key**):

```
----BEGIN PGP PUBLIC KEY BLOCK-----
Version: OpenPGP.js v4.4.5
Comment: https://openpgpjs.org
```

**F.2** Using the Node.js code at the following link, generate a key:

https://asecuritysite.com/encryption/openpgp

Note: to add opengpg, you can install the required library with:

#### npm install openpgp

**F.3** An important element in data loss prevention is encrypted emails. In this part of the lab we will use an open source standard: PGP.

In this challenge, you should install a random number generator on your system with:

#### sudo apt-get install rng-tools

No	Description	Result
1	Create a key pair with (RSA and 2,048-bit keys):	
	gpggen-key	How is the randomness generated?
	Now export your public key using the form of:	
	gpgexport -a "Your name" > mypub.key	
	Now export your private key using the form of:	Outline the contents of your key file:
	<pre>gpgexport-secret-key -a "Your name" &gt; mypriv.key</pre>	

2	Now send your lab partner your public key in the contents of an email, and ask them to import it onto their key ring (if you are doing this on your own, create another set of keys to simulate another user, or use Bill's public key – which is defined at http://asecuritysite.com/public.txt and send the email to him):	Which keys are stored on your key ring and what details do they have:
	gpgimport theirpublickey.key	
	Now list your keys with:	
	gpglist-keys	
3	Create a text file, and save it. Next encrypt the file with their public key:	What does the –a option do:
	gpg -e -a -u "Your Name" -r "Your Lab Partner Name" hello.txt	What does the –r option do:
		What does the –u option do:
		Which file does it produce and outline the format of its contents:
4	Send your encrypted file in an email to your lab partner, and get one back from them.	Can you decrypt the message:
	Now create a file (such as myfile.asc) and decrypt the email using the public key received from them with:	
	<pre>gpg -d myfile.asc &gt; myfile.txt</pre>	
5	Next using this public key file, send Bill (w.buchanan@napier.ac.uk) an encrypted question (http://asecuritysite.com/public.txt).	Did you receive a reply:
6	Next send your public key to Bill (w.buchanan@napier.ac.uk), and ask for an encrypted message from him.	

# H Reflective statements

1. In ECC, we use a 256-bit private key. This is used to generate the key for signing Bitcoin transactions. Do you think that a 256-bit key is largest enough? If we use a cracker what performs 1 Tera keys per second, will someone be able to determine our private key?

### I What I should have learnt from this lab?

The key things learnt:

- The basics of the RSA method.
- The process of generating RSA and Elliptic Curve key pairs.
- To illustrate how the private key is used to sign data, and then using the public key to verify the signature.

### **Additional**

The following is code which performs RSA key generation, and the encryption and decryption of a message (https://asecuritysite.com/encryption/rsa example):

```
from Crypto.PublicKey import RSA
from Crypto.Util import asn1
from base64 import b64decode
from base64 import b64encode
from Crypto.Cipher import PKCS1_OAEP
import sys
msg = "hello..."
if (len(sys.argv)>1):
          `msg=str(sys.argv[1])
key = RSA.generate(1024)
binPrivKey = key.exportKey('PEM')
binPubKey = key.publickey().exportKey('PEM')
print
print "====Private key==="
print binPrivKey
print "====Public key==="
print binPubKey
privKeyObj = RSA.importKey(binPrivKey)
pubKeyObj = RSA.importKey(binPubKey)
cipher = PKCS1_OAEP.new(pubKeyObj)
ciphertext = cipher.encrypt(msg)
print
print "====Ciphertext==="
print b64encode(ciphertext)
cipher = PKCS1_OAEP.new(privKeyObj)
message = cipher.decrypt(ciphertext)
print
print
print "====Decrypted==="
print "Message:",message
```

#### Can you decrypt this:

**A.3** On your VM, go into the ~/.ssh folder. Now generate your SSH keys:

ssh-keygen -t rsa -C "your email address"

The public key should look like this:

AAAAB3NzaC1yc2EAAAADAQABAAABAQDLrriuNYTyWuC1IW7H6yea3hMV+rm029m2f6IddtlImHrOXjNwYyt4Elkkc7AzOy899C3gpxOkJK45k/CLbPnrHvkLvtQOAbzwEQpOKxI+tw06PcqJNmTB8ITRLqIFQ++ZanjHwMw2Odew/514y1dQ8dccCOuzeGhL2Lq9dtfh5xx+1cBLcyoSh/1Qcs1HpXtpwU8JMxwJ1409RQOVn3gOusp/P/OR8mz/RwkmsFsyDRLgQK+xtQxbpbodpnz5lIOPwn5LnT0si7eHmL3WikTyg+QLZ3D3m44NCeNb+bOJbfaQ2ZB+lv8C3OxylxSp2sxzPZMbrZwqGSLPjgDiFIBLw.buchanan@napier.ac.uk

View the private key. What is the **DEK-Info** part, and how would it be used to protect the key, and what information does it contain?

On your Ubuntu instance setup your new keys for ssh:

ssh-add ~/.ssh/id\_git

Now create a Github account and upload your public key to Github (select Settings-> New SSH key or Add SSH key). Create a new repository on your GitHub site, and add a new file to it. Next go to your Ubuntu instance and see if you can clone of a new directory:

git clone ssh://git@github.com/<user>/<repository name>.git

If this doesn't work, try the https connection that is defined on GitHub.
